Notes: * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$. The $\hat{\delta}$ interaction is one-tailed for column (1)/(3) under Campello's $\delta > 0$ cash hypothesis and *two-tailed* for column (2) (no directional hypothesis for CEO residual uncertainty); controls two-tailed. Significant coefficients in **bold**. n.r. = not reported by Campello. Standard errors (in parentheses) double-clustered at the firm and calendar-quarter levels (verbatim Table 8 caption). Both rebuild columns are the *same* canonical full-sample eq. (14): panel = 2010:Q1–2016:Q4 (unbalanced) for the β^{UK} -tercile treated/control firms, POST = 1 only 2016:Q3–Q4; CASH = $cheq_t / (atq_{t-1} - cheq_{t-1})$ (Table 8 caption); 5 firm controls lagged one calendar quarter; consensus EPS native/forward; FIRM FE + INDUSTRY(FIC100) $\times$ QUARTER FE; macro mechanically absorbed by the time side of that FE. Only the dependent variable differs. Column (2) DV = *UncResCEO*, the CEO Q&A residual uncertainty from the DWZ Eq. 4 full-sample decomposition (call-level), bridged file-name $\rightarrow$ gvkey via the H1 earnings-call panel, assigned to the calendar quarter of the call date and averaged per firm-quarter; it is *not* winsorized (a pre-cleaned regression residual). It has no Campello Table 8 benchmark (Table 8 covers CASH, NWC, PROFITS only) — a novel extension, not a replication target. Its smaller N reflects the earnings-call $\cap$ H1 $\cap \beta^{UK}$ -tercile intersection. Column (3) reproduces the verbatim Campello reference: Campello et al. 2022 JFQA, Table 8 col.1, journal p.3208 (verbatim). [†]Campello's R^2 includes absorbed fixed effects; rebuild columns report within- R^2 (not directly comparable). The Campello figures are a reference benchmark, *not* an estimation or tuning target; this table reports the rebuild's measured output only and asserts no replication verdict.
